

Signal Mirror 27177

- 1) First of all, make sure that the mirror's surface is dry and clean.**

- 2) Hold the mirror in front of the eye. Direct the reflection of the mirror onto any nearby object.**

- 3) Look for the position of the reflection through the central hole. A bright red spot appears. It indicates the direction of the aim.**

- 4) Keep this red spot and direct it slowly on the target point or the rescuer. The mirror is then in a good position.**

- 5) Give it small movements to create luminous flashes.**

- 6) If no rescuer is in view, scan the horizon with the red spot. Flashes of light can be seen for up to 10 Km.**
